evaluated guarded condition expression / value	previous state	accepting state	is error state
in_sql_event_log('DELETE.department.YR_ASSET', STATE(d))	True	False	True

Figure 7: YRI-DB-RUNTIME-VERIF operation WORKFLOW.

1 Introduction

Figure 8: SOFTWARE ARCHITECTURE OF YRI-DB-RUNTIME-VERIF.

This user's guide helps briefly and concisely how to create a binary executable of the runtime monitoring testing tool **YRI-DB-RUNTIME-VERIF** having user defined runtime monitors. The guide also specifies keywords allowed within runtime monitor specifications as State Diagram Mealy Machines.

YERITH_QVGE (YRI_QVGE) could be used for the following automatic generation, analysis, verification, and validation tasks:

1. Automatic generation of runtime monitoring module program to prove whether a test procedure, automated, or not, is correct with regards to a test and / or design STATE DIAGRAM MEALY MACHINE (formally described in [Nou23]).

In effect, let the test execution be runtime monitored to watch whether accepting error states would be found.

For instance, Junit testing environment could automatically integrate an automatically generated runtime monitor infrastructure for unit testing.

2. Automatic generation of runtime monitoring module program for any software that can emit Dbus messages.

"Such runtime monitoring modules are for interest for special LTL model checking properties that cannot get a definite answer through use of a conventional model checker".

3. Software design properties with SQL
4. Software design properties including event sequences over different layers of software system architecture
5. Class diagram with sequence diagram.

³Scientific: fail (forbidden) trace.

⁴Structure Query Language.

2 YERITH_QVGE (YRI_QVGE) Short Overview

Figure 9: YERITH_QVGE software library dependencies.

YERITH_QVGE is a CASE (Computer-Aided Software Engineering) design tool to generate "domain-specific language (DSL) YRI_SD_RUNTIME_VERIF_LANG ¹" files, to be inputted into the "compiler YRI_SD_RUNTIME_VERIF_LANG_COMP", so to generate C++ files for the "runtime verifier tester YRI-DB-RUNTIME-VERIF ²" that allows for manual verification of SQL correctness properties of Graphical User Interface (GUI) software.

Figure 10 illustrates a workflow diagrammatically of the afore described process.

Figure 9 show a diagram of the afore described process; The step of the unit tests is colored in gray because it is only for developers of YERITH_QVGE intended.

YRI-DB-RUNTIME-VERIF inputs SQL correctness properties expressed using the formalism "state diagram mealy machine (YRI_SD_RUNTIME_VERIF_LANG)". Figure 8 illustrates a software system architecture of YRI-DB-RUNTIME-VERIF, together with the monitored program under analysis. The Free Open Source Code Software (FOSS) tool-chain of development testing is located as follows for free, EXCEPT for "YERITH_QVGE " that is a Closed Source Code Software (CSCS):

- COMPILER (i.e.: YRI_SD_RUNTIME_VERIF_LANG_COMP):
https://github.com/yerithd/yri_sd_runtime_verif_lang
- RUNTIME VERIFIER TESTER (i.e.: YRI-DB-RUNTIME-VERIF):
<https://github.com/yerithd/yri-db-runtime-verif>
- state diagram mealy machine UNIT TESTS CODE (i.e.: YRI_SD_RUNTIME_VERIF_UNIT_TESTS):
https://github.com/yerithd/yri_sd_runtime_verif_UNIT_TESTS
- state diagram mealy machine (i.e.: YRI_SD_RUNTIME_VERIF_LANG):
https://github.com/yerithd/yri_sd_runtime_verif

3 YERITH_QVGE (YRI_QVGE) Project Dependency

Table 2: YERITH_QVGE Design and Testing System Dependencies

PROJECT	Required Program / Library
1) YRI_SD_RUNTIME_VERIF_LANG	
2) YRI_SD_RUNTIME_VERIF_LANG_COMP	1)
3) YRI_SD_RUNTIME_VERIF_UNIT_TESTS	1)
4) YRI-DB-RUNTIME-VERIF	2)

Table 2 illustrates for each library project, which others it depends on.

4 Advantages of YERITH_QVGE

A sample state diagram mealy machine is shown in Figure 4.

WITH manual drawing of SQL CORRECTNESS PROPERTY MODEL, you are freed from manually writing "state diagram mealy machine text files" that could be tedious and lengthy. Also, editing state diagram mealy machine files manually could be more error-prone than letting a compiler (YRI_SD_RUNTIME_VERIF_LANG) do it for you.

5 State Diagram Mealy Machine (SDMM)

TABLE 1 depicts scientific keywords and their engineering counterpart that can be used in describing NOT DESIRABLE³ SQL⁴ call sequence state diagram mealy machine in YERITH_QVGE Design and Testing System.

A STATE DIAGRAM mealy machine specification is compiled into C++ code that describes a runtime monitor to be executed in the runtime monitoring tester YRI-DB-RUNTIME-VERIF. Figure 4 depicts a sample State Diagram Mealy Machine specification on a NOT DESIRABLE SQL call sequence.

5.1 HOW TO READ A "SDMM"

Figure 1 shows a finite automaton representation of the mealy machine description in Figure 4. It shall be read as follows:

- The program is in a start state *D*; state *D* is a start state since there is incoming "START" arrow into it.
- (Pre-) Condition Q_0 : "department name 'YRI_ASSET' is not in table column 'department_name' of database table 'department'"; applies in state *D*.
- Whenever GUARD CONDITION : ***in_sql_event_log('DELETE.department.YRI_ASSET', STATE(d))***: "event 'DELETE.department.YRI_ASSET' appears in SQL event log (trace) leading to state *D*"; applies in state *D*, system under test (SUT) event 'SELECT.department' could occur.
- When SUT event 'SELECT.department' occurs, SUT is now in state *E*; state *E* is an error state because the node that represents it in Figure 1 has 2 circles on it.
- (Post-) Condition Q_1 : "department name 'YRI_ASSET' is in table column 'department_name' of database table 'stocks'"; applies in state *E*.

This shall not be the case since department 'YRI_ASSET' is no more defined in SUT database table 'department'.

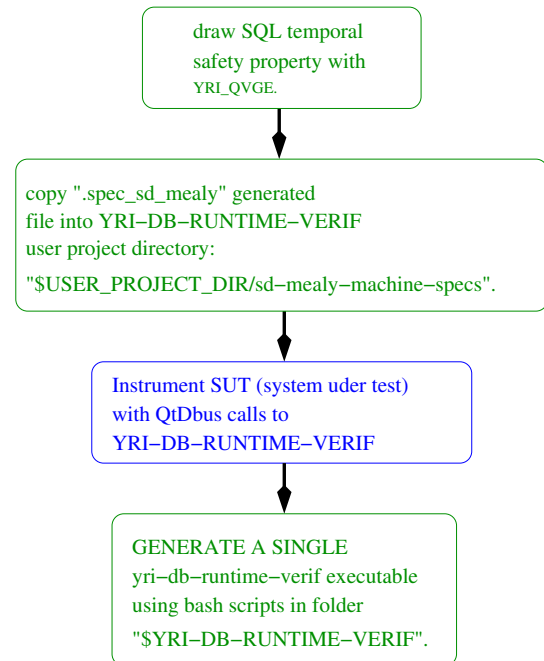

5.2 "SDMM" WITH MORE THAN 2 STATES

State Diagram Mealy Machines (SDMM) with more than 2 states have following characteristics, as detailed in scientific and engineering journal paper [Nou23] in preparation:

- Only the first transition has a pre-condition specification
- Each other transition only has a post-condition specification
- Since each state only has 1 outgoing state transition, the post-condition of the previous (incoming) state transition acts as the pre-condition of the next transition.

6 YERITH_QVGE (YRI_QVGE) Workflow

Figure 10: Workflow explanation.

The "Design and Testing System" YERITH_QVGE works with following workflow, as illustrated graphically in Figure 10, and in Figure 7:

1. Draw Structure Query Language (SQL) temporal safety property using drawing tool YERITH_QVGE;
2. copy the generated ".spec_sd_mealy" files into a user project directory in YRI-DB-RUNTIME-VERIF home development folder: "\$YRI-DB-RUNTIME-VERIF";
3. follow the steps described in Section 7 so to gather a single executable that defines all specified runtime monitors.

7 Custom User Project (YRI-DB-RUNTIME-VERIF)

Table 3: YRI-DB-RUNTIME-VERIF Directories

Variable for illustration purposes	Meaning
\$YRI-DB-RUNTIME-VERIF	root directory of YRI-DB-RUNTIME-VERIF
\$YRI-DB-RUNTIME-VERIF/\$USER_PROJECT	root directory of user project

Table 3 illustrates directories that will be used to describe a process to generate a single binary executable for a user's custom project with several runtime monitor specifications.

Figure 6 illustrates a screenshot of the Graphical User Interface (GUI) of YRI-DB-RUNTIME-VERIF. You can get a copy of YRI-DB-RUNTIME-VERIF using the following command:

git clone <https://github.com/yeriothd/yri-db-runtime-verif>

Creating a binary executable for State Diagram Mealy Machine (SDMM) specifications consists of the following elements:

1. **'MariaDB' database connection configuration file:** this file defines settings to connect to the system under test (SUT) application database; it is located in path: "**\$YRI-DB-RUNTIME-VERIF/YRI-DB-RUNTIME-VERIF-GUI-ELEMENTS-SETUP/yri-db-runtime-verif-database-connection.properties**".

A database connection to the SUT application database is required in order to check LTL property through the SDMM application library YRI_SD_RUNTIME_VERIF_LANG.

2. **Property configuration file:** this file defines environment variables necessary for building a binary executable for the user; it is located in path: "**\$YRI-DB-RUNTIME-VERIF/\$USER_PROJECT/bin/configuration-properties.sh**".
3. "**\$YRI-DB-RUNTIME-VERIF/\$USER_PROJECT/sd-mealy-machine-specs**": this directory contains user defined State Diagram Mealy Machine (SDMM) specifications to generate Corresponding runtime monitors within a single binary executable.
4. **Generate an executable for a user defined runtime monitor:**
 - a) execute following command in directory "**\$YRI-DB-RUNTIME-VERIF**":

```
./YRI-create-executable-for-user-SDMM.sh -d $USER_PROJECT
```
 - b) modify the LTL verification code part within the generated source code files.

Then execute following command in directory "**\$YRI-DB-RUNTIME-VERIF**":

```
./yr_db_runtime_verif_BUILD_DEBIAN_PACKAGE.sh
```

- c) uninstall YRI-DB-RUNTIME-VERIF with following command in directory "**\$YRI-DB-RUNTIME-VERIF**":

```
./yr_DB_RUNTIME_VERIF_uninstall.sh
```

- d) re-install YRI-DB-RUNTIME-VERIF with following command in directory "**\$YRI-DB-RUNTIME-VERIF**":

```
./yr_DB_RUNTIME_VERIF_INSTALL.SH
```

8 HOW TO START YRI-DB-RUNTIME-VERIF

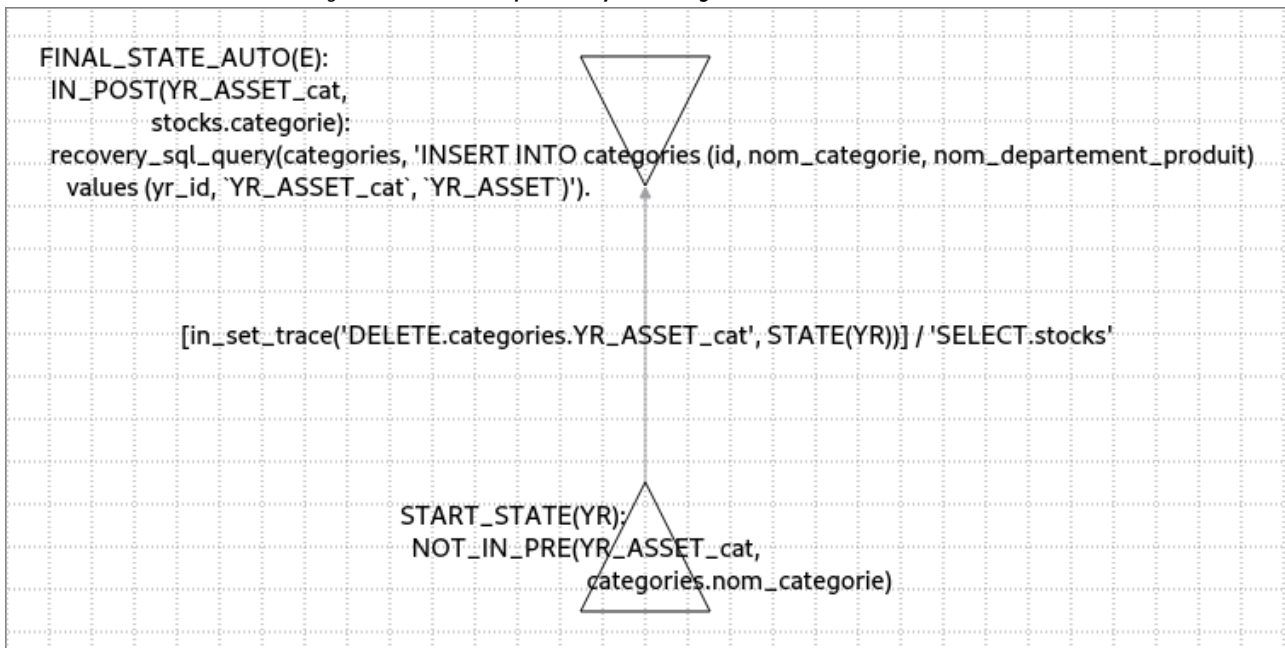

- The "ELF-x64" binary executable, in the source development directory is located in full path: "**\$YRI-DB-RUNTIME-VERIF/bin**".
- The **DEBIAN-LINUX** icon () of YRI-DB-RUNTIME-VERIF is located in "Applications" menu under section "Programming", and section "Accessories".
- The "ELF-x64" binary executable, after installation of the **DEBIAN-LINUX** package 'yri-db-runtime-verif.deb' is located in full path: "/opt/yri-db-runtime-verif/bin".

Figure 11: **SAMPLE sql recovery state diagram model in YERITH_QVGE**

9 SQL QUERY Recovery execution on demand

A user can specify which SQL command query to execute whenever a System Under Test (SUT) lands in an accepting error state. This is done using keywords ending with "AUTO", used for meaning "AUTO RECOVERY FROM FAIL STATE":

1. **recovery_sql_query**
2. **END_STATE_AUTO**
3. **FINAL_STATE_AUTO**
4. **ERROR_STATE_AUTO.**

The use of an "AUTO" keyword shall be accompanied with a use of keyword **recovery_sql_query**, that specifies a SQL

command query to run when landing in this fail error accepting state.

9.1 Automatic SQL Command Query Generation

YERITH_QVGE implements an automatic SQL query generation strategy in case a user don't specify a SQL command query, since it could be leaved empty: Subsections 9.1.1, 9.1.2, 9.1.3, and 9.1.4 describe the strategy implemented.

9.1.1 ERROR ACCEPTING STATE for sdmm 1.

not in_before (YX, YY) ACTION (V)
in_after (DD, YR)

9.1.2 RECOVERY 1.

$$\frac{\text{in_after}(\text{DD}, \text{YR}) \quad \text{ACTION}(\text{RECOVERY_ND})}{\text{not in_after}(\text{DD}, \text{YR})}$$

9.1.3 RECOVERY 2 (Practical solution to be implemented in YRI-DB-RUNTIME-VERIF.

$$\frac{\text{in_after}(\text{DD}, \text{YR}) \quad \text{ACTION}(\text{RECOVERY_D})}{\text{in_after}(\text{YX}, \text{YY})}$$

9.1.4 Concrete RECOVERY 2 action.

$$\frac{\text{in_after}(\text{YX}, \text{YY}) \quad \text{insert_RECOVERY}(\text{YX}, \text{YY})}{\text{in_before}(\text{YX}, \text{YY})} \bullet$$

10 Formal Scientific and Engineering Project Description

Detailed formal scientific and engineering contributions of design and testing system YERITH_QVGE can be found in **JOURNAL ARTICLE "Runtime Verification Of SQL Correctness Properties with YRI-DB-RUNTIME-VERIF"** [Nou23].

11 Conclusion

The graphical drawing tool YERITH_QVGE (Figure 5) costs only 2,500 EUROS. WE ONLY SUPPORT DEBIAN-LINUX (<https://www.debian.org>).

1 Developer Biography

Prof. Dr.-Ing. Xavier Noundou is a CHRISTIAN BY FAITH, Cameroonian, born on September 16 1983 in DOUALA (LITTORAL region, CAMEROON). Xavier has a "Diplom-Informatiker (Dipl.-Inf.)" qualification from the **University of Bremen, Bremen, GERMANY** (May 25, 2007). XAVIER NOUNDOU IS A "DEng : Doctor of Engineering (PhD equivalent – Computer Software Verification & Analysis)" from **THE UNIVERSITY OF WATERLOO (ON, CANADA); DECEMBER 20, 2011!**

Prof. Dr.-Ing. Xavier Noundou has worked together with **Prof. Dr. rer. nat. habil. Jan Peleska**, at AGBS–University of Bremen, GERMANY; and 2 years later at WatForm–University of Waterloo, ON, Canada, with **DR. Patrick Lam**.

Xavier could successfully work with **Dr. Frank Tip** at The University of Waterloo (Waterloo, ON, Canada) on his first JAVA dynamic program analysis.

Xavier also had the great opportunity through **DR. Marcel Mitran** and **DR. Patrick Lam**; to work as a graduate intern in Markham (Toronto, ON, CANADA) at IBM TORONTO SOFTWARE LABORATORY; in the JAVA–J9 Just-In-Time Compiler Optimization Team, together with **Vijay Sundaresan, M.Sc. (McGill University, QC, Canada)**.

Xavier has following academic and professional engineering research contributions:

1. 'Statistical test case generation for reactive systems' at RTT-MBT at VERIFIED SYSTEMS INTERNATIONAL GmbH (<https://www.verified.de>).
2. 'Context-Sensitive Staged Static Taint Analysis For C using LLVM':

1. source code in C++:

2 Introduction

Figure 5: SOFTWARE ARCHITECTURE OF YRI-DB-RUNTIME-VERIF.

YERITH_QVGE is a CASE (Computer-Aided Software Engineering) design tool to generate "domain-specific language (DSL) YRI_SD_RUNTIME_VERIF_LANG¹" files, to be inputted into the "compiler YRI_SD_RUNTIME_VERIF_LANG_COMP", so to generate C++ files for the runtime verifier tester "YRI-DB-RUNTIME-VERIF²" that allows for manual verification of SQL correctness properties of Graphical User Interface (GUI) software.

YRI-DB-RUNTIME-VERIF inputs SQL correctness properties expressed using the formalism state diagram mealy machine (YRI_SD_RUNTIME_VERIF_LANG). Figure 5 illustrates a software system architecture of YRI-DB-RUNTIME-VERIF, together with the monitored program under analysis. The Free Open Source Code Software (FOSS) tool-chain of development testing is located as follows for free, EXCEPT for "YERITH_QVGE" that is a Closed Source Code Software (CSCS):

- COMPILER (i.e.: YRI_SD_RUNTIME_VERIF_LANG_COMP):
https://github.com/yerithd/yri_sd_runtime_verif_lang
- RUNTIME VERIFIER TESTER (i.e.: YRI-DB-RUNTIME-VERIF):
<https://github.com/yerithd/yri-db-runtime-verif>
- state diagram mealy machine UNIT TESTS CODE (i.e.: YRI_SD_RUNTIME_VERIF_UNIT_TESTS):
https://github.com/yerithd/yri_sd_runtime_verif_UNIT_TESTS
- state diagram mealy machine (i.e.: YRI_SD_RUNTIME_VERIF_LANG):
https://github.com/yerithd/yri_sd_runtime_verif

3 YERITH_QVGE (YRI_QVGE) Project Dependency

Table 2: YERITH_QVGE Design and Testing System Dependencies

PROJECT	Required Library
1) YRI_SD_RUNTIME_VERIF_LANG	
2) YRI_SD_RUNTIME_VERIF_LANG_COMP	1)
3) YRI_SD_RUNTIME_VERIF_UNIT_TESTS	1)
4) YRI-DB-RUNTIME-VERIF	2)

Table 2 illustrates for each library project, which others it depends on.

Figure 6: YERITH_QVGE software library dependencies.

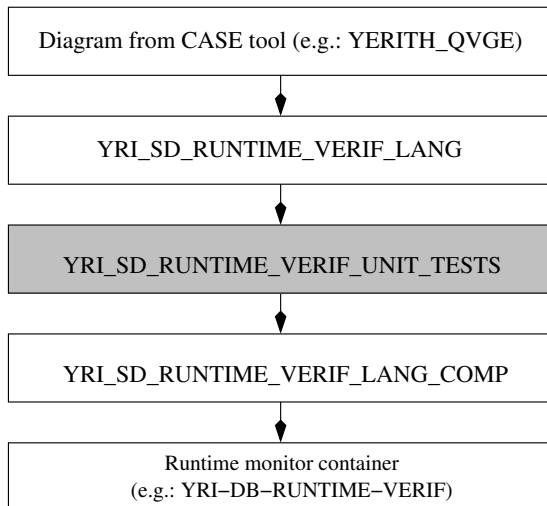

Figure 6 show a diagram overview of the presentation in Table 2. The step of the unit tests is colored in gray because it is only for developers of YERITH_QVGE intended.

4 Potential Uses of YERITH_QVGE

YERITH_QVGE (YRI_QVGE) could be used for the following automatic generation, analysis, verification, and validation tasks:

1. Automatic generation of runtime monitoring module program to prove whether a test procedure, automated, or not, is correct with regards to a test and / or design STATE DIAGRAM MEALY MACHINE.

In effect, let the test execution be runtime monitored to watch whether accepting error states would be found.

For instance, Junit testing environment could automatically integrate an automatically generated runtime monitor infrastructure for unit testing.

2. Automatic generation of runtime monitoring module program for any software that can emit DBus messages.

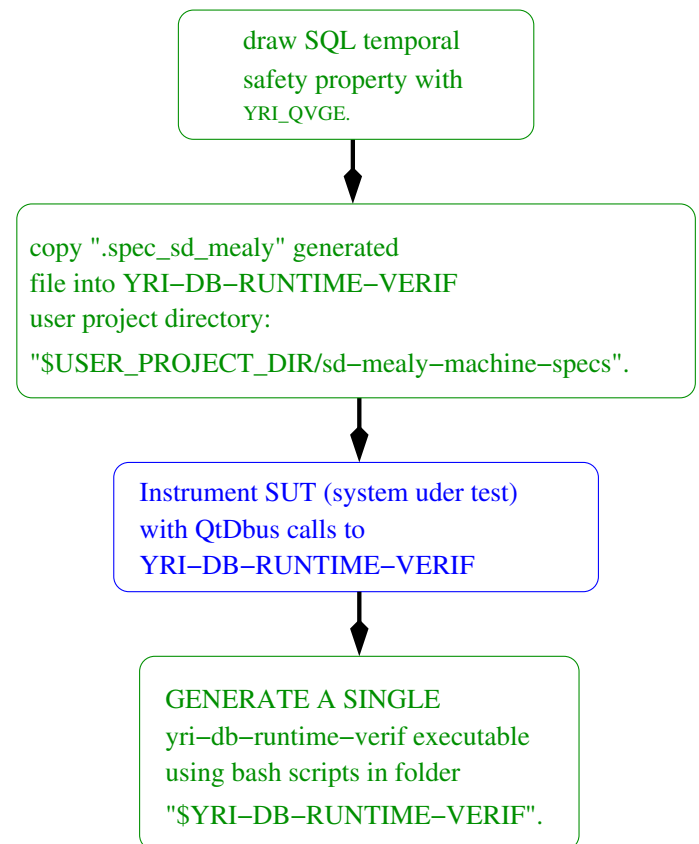

Such runtime monitoring modules are for interest for special LTL model checking properties that cannot get a definite answer through use of a conventional model checker.

3. Software design properties with SQL
4. Software design properties including event sequences over different layers of software system architecture

5. Class diagram with sequence diagram.

5 Advantages of YERITH_QVGE

Figure 7: Workflow.

A sample state diagram mealy machine is shown in Figure 2.

WITH manual drawing of SQL CORRECTNESS PROPERTY MODEL, you are freed from manually writing "state diagram mealy machine text files" that could be tedious and lengthy. Also, editing state diagram mealy machine files manually could be more error-prone than letting a compiler (YRI_SD_RUNTIME_VERIF_LANG_COMP) do it for you.

6 Conclusion

YERITH_QVGE costs only 2,500 EUROS. WE ONLY SUPPORT DEBIAN-LINUX (<https://www.debian.org>).
